

Vein Clinic | Cosmetic Medical Clinic | Dr. Nicholas J Morison CCFP

POST BIOPSY WOUND CARE

Day 1- Leave original dressing in place until next morning

Day 2- After showering, pat wound dry with clean towel and apply thin layer of Polysporin Triple. Cover with a light Band-Aid that allows some air to enter

Once the wound(s) has stopped oozing, leave it uncovered providing clothing is not rubbing it. A wound that stays under a soggy, wet Band-Aid is more apt to become infected and heal poorly

Sutures (stitches) are removed as per the Doctor's instructions

Signs of infection include: Redness, swelling, warmth, increased pain and oozing of pus

We will contact you between 1 and 4 weeks with results. If you are concerned about how the wound(s) is healing you are welcome to visit the doctor, you can reach us at 780-459-7769.
